Table of contents

1 high.....	2
2 medium.....	2
3 low.....	2

1. high

- [src] Improve network failure handling of distributable cluster configurations where databases co-reside on peer nodes. # PF
- [src] Minimize table/row locking during diff and full synchronization strategies. # PF
- [src] Create a feasible synchronization strategy for large databases. # PF

2. medium

- [doc] Update performance graphs with results from latest version. # PF

3. low

- [src] Support for using HA-JDBC in conjunction with native database replication capabilities. HA-JDBC would add high-availability to cluster through multiple master support while hiding write-to-master/read-from-slave details from the application. # PF
- [src] Investigate the potential of SQLState codes as a replacement for secondary isAlive() queries when determining how to handle failures. # PF
